How AI is reshaping finance

How AI is reshaping finance

In this course...

- Practical ways to apply AI
- Hands-on experience
- Frameworks to use
- Transferable methods

Augmentation and automation

Augmentation
Supports your judgment as needed
Example: using Copilot or other tool to summarize a 10-K

Automation
Takes over routine steps automatically
Example: an agent that schedules and generates monthly reports

- Augmentation is common in finance
- Automation is growing quickly

AI toolbox

Tool	Strength
Copilot	Summarizes earnings calls, explains filings, drafts variance commentary, native Microsoft integration
perplexity	Research-focused: market news, peer benchmarking, regulatory tracking

AI toolbox

Tool	Strength
n8n	Connects apps and automates workflows without code
make	Builds custom integrations and streamlines recurring tasks

AI toolbox

Tool	Strength
ChatGPT	Versatile, outlines presentations, explores concepts, generates code, and more
Claude	Versatile, excels at reasoning and coding
Gemini	Versatile, handles long context, especially

Know your limits

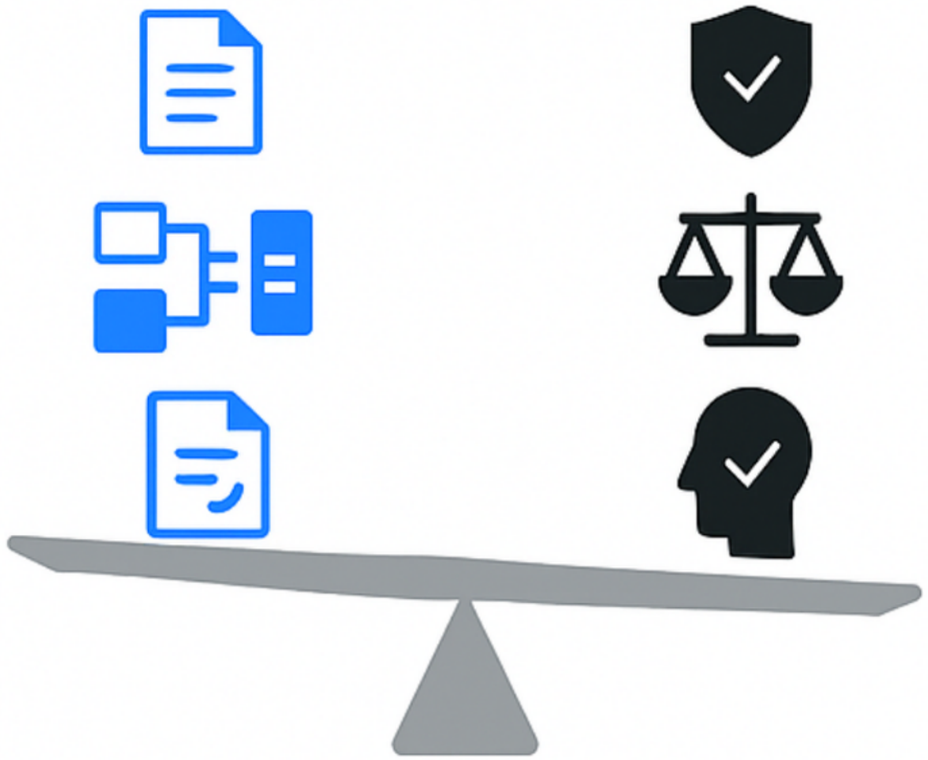

What AI does well

- Processes documents at speed
- Combine structured and unstructured data
- Produces clear first drafts

What AI can't do

- May hallucinate or misinterpret context
- Misses company-specific nuances
- Doesn't replace compliance or judgment

> Professional expertise is **crucial** to validate AI outputs, ensure compliance, and uphold ethical financial practices.

Let's practice!

AI FOR FINANCE

Exploring AI-assisted financial analysis

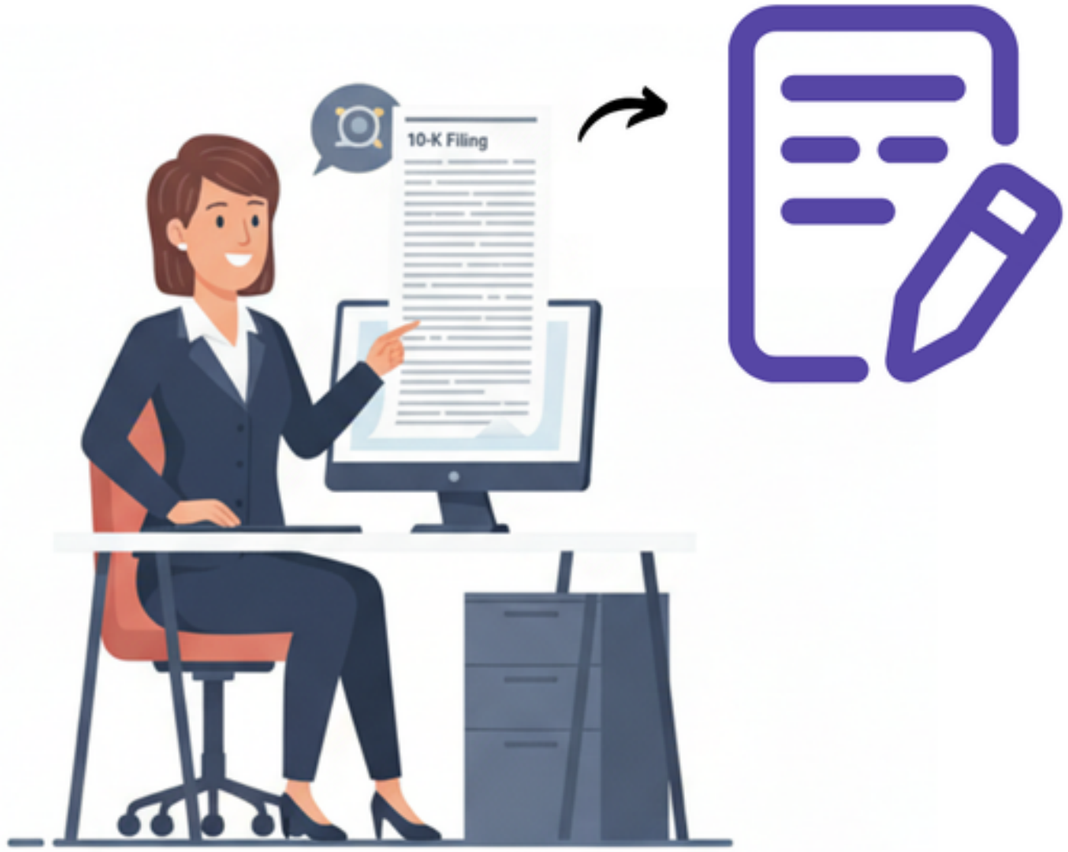

AI FOR FINANCE

The challenge of financial documents

- 10-Ks, transcripts, and financial statements are essential but time-consuming
- Finance pros spend hours scanning dense reports
- AI helps extract insights **faster** and **more effectively**

Rapid file interaction

- Upload transcripts or filings for instant queries
- Use prompts and ask targeted questions instead of scanning manually
- Transform static reports into interactive, searchable content

Analyze tone

- Understand *how* management speaks, not just what is said
- Detect confidence, caution, or hedging in transcripts
- Compare tone between companies for deeper insight

Handle varied data

- AI works with financial statements as well as transcripts
- Example: upload Apple's quarterly results for a year-over-year variance analysis
- Combine numbers with narrative for richer insight

Extract insights

- Summarize long filings into key messages
- Extract challenges, initiatives, or risk factors
- Focus on what executives want investors to notice

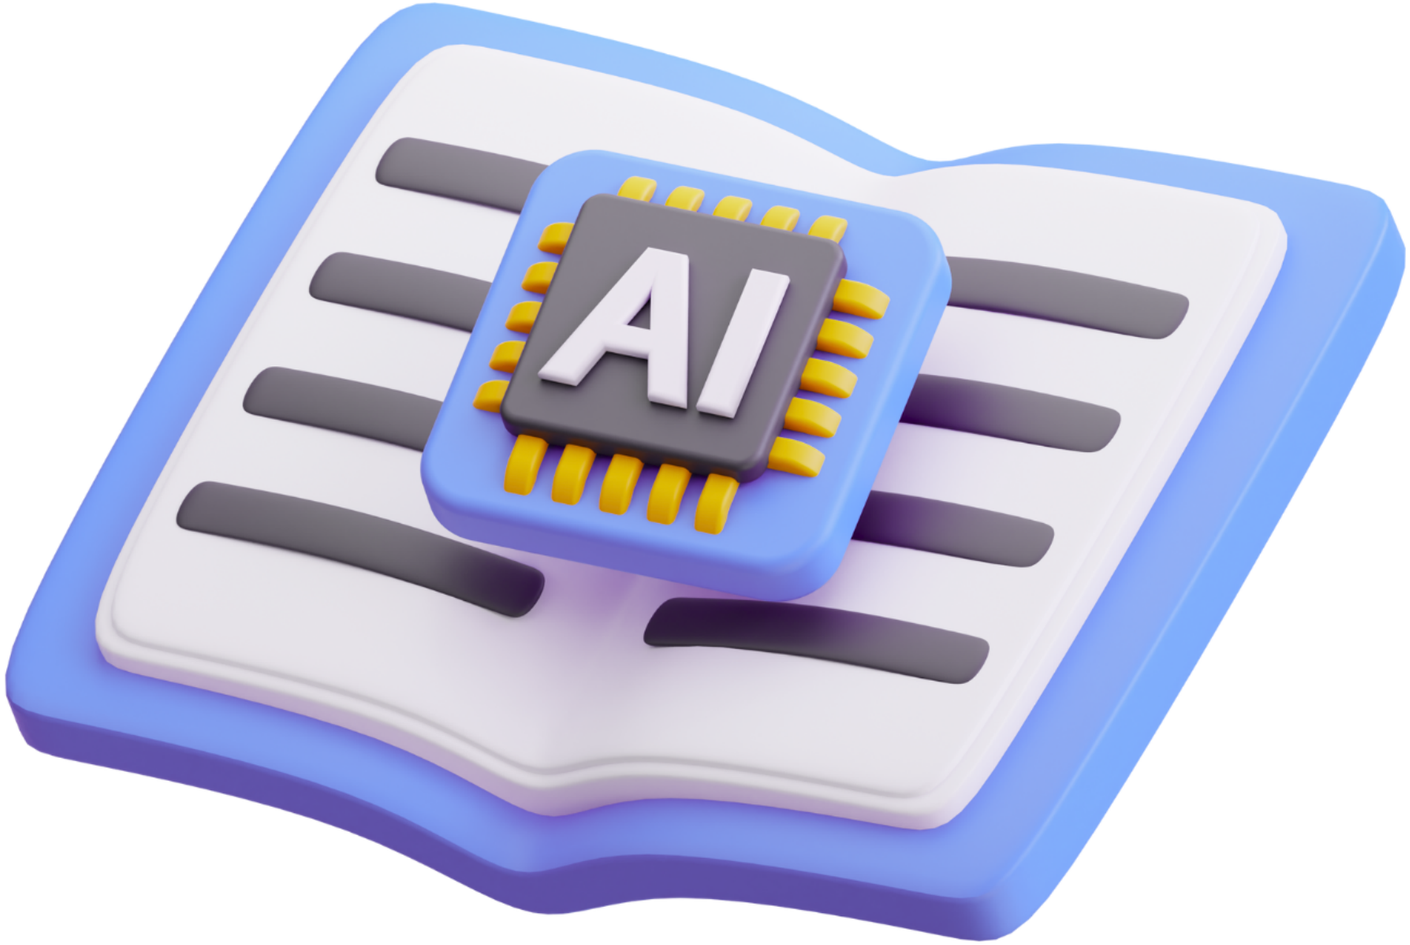

From raw data to actionable insights

- File upload, tone analysis, and insight extraction work together

- Synthesize qualitative and quantitative findings
- Build executive-ready summaries in minutes, not hours

AI

Let's practice!

AI FOR FINANCE

Driving predictable outputs with prompt templates

AI FOR FINANCE

Why reusable prompts matter

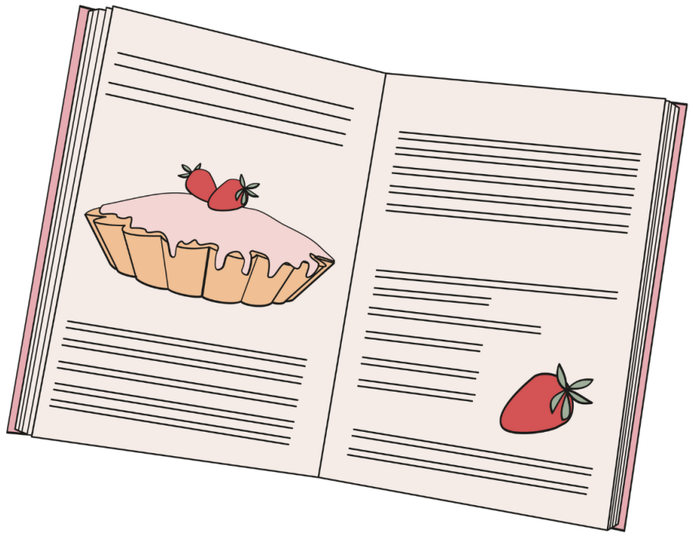

The challenge

- Finance = repetition
- Quarter after quarter, same analyses

The solution

- A reusable prompt is like a recipe
- Steps stay the same. Ingredients change

Prompts as templates

- **Variables**: the inputs you'll change, such as company name, date range, or file.
- **Constraints**: the guardrails that stay fixed, like bullet counts, chart type, or CSV fields.

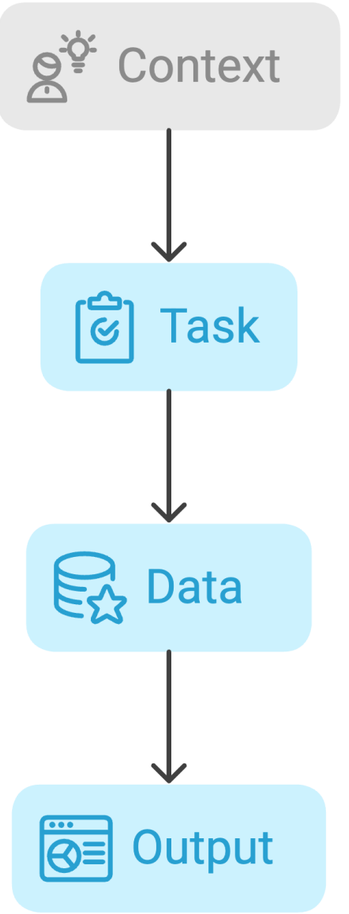

Structure of a reusable prompt

Context: The situation or purpose

Task: What we want the AI to do

Data: Which inputs it should use

Output: The format we want back

Section	Details
Context	You are a financial analyst and need to brief leadership on recent stock performance
Task	Describe patterns in price and trading activity
Data	Use the uploaded dataset
Output	Provide 5 bullet-point insights and a line chart of Close prices for the last 2 quarters

Response

Here's a leadership-ready summary of Orion Technologies' stock performance over the last two quarters (July–December 2024):

📊 Key Insights

- 📈 **Stock price rose** from **$167.40 in July** to **$176.50 in December**, showing a steady upward trend.
- 🚀 **October** recorded the **highest monthly gain** of **$3.39**, indicating strong investor confidence.
- ⚠️ **August** and **September** saw **minor declines** of **$-0.78** and **$-0.54**, respectively.
- 📉 **December** had the **highest trading volume** with **56,000,000 shares**, suggesting heightened market activity.
- 🔍 **Price changes were relatively stable**, averaging **$1.57 per month**, indicating low volatility.

The takeaway

- Save time
- Reduce errors
- Enable comparisons

> Don't reinvent prompts. Reuse them.

Let's practice!
